

Python is a popular programming language that acts like a bridge between you and a computer. It allows you to give the computer instructions in a way that is very easy for humans to read and write, similar to the English language. ****Key Features of Python:**** 1. ****Easy to Read:**** Its rules (syntax) are simple. Unlike other languages that use complicated symbols, Python uses words like 'print', 'if', and 'not'. 2. ****Versatile:**** You can use it for many things, such as building websites, analyzing data, creating Artificial Intelligence, or even just automating simple tasks on your laptop. 3. ****Beginner-Friendly:**** Because it is so clear, it is often the first language people learn when they start coding. ****How it looks (Code Examples):**** To show a message on the screen, you only need one line of code: `python print("Hello, Anuradha!")` To perform a simple math calculation, you can write: `python # Adding two numbers together apples = 5 oranges = 10 total_fruit = apples + oranges print(total_fruit)` In this example, Python stores the numbers in "variables" (think of them as labeled boxes) and then adds them together just like you would in a math class.
